

Manual red blood cell count calculation

I'm not robot!

The red blood cell count on the routine CBC is the concentration of red blood cells, expressed in millions/ μ L of whole blood. While red blood cell counts can be performed by manual techniques, such as a hemocytometer, these are time-consuming and inaccurate. We do, however, use them for counting RBC in fluids with low cell counts, such as cerebrospinal fluid (CSF). Automated counts are most commonly performed using electronic impedance or laser light scattering (flow cytometry). The latter is the technique used by the hematology analyzer at Cornell University, except under specific situations (see below). Method of measurement Manual counts Hemocytometer Manual cell counts (RBC, nucleated cells or platelets) are performed using a hemocytometer. This is specifically done on body cavity fluids that are poorly cellular (
